Start here

DocMan Alert keeps your factory's compliance documents, employee licenses and health checkups in one place and emails the right people before anything expires. This manual shows each screen, tells you what to click, and explains what happens next.

Your first ten minutes

1. **Sign in** with the username and password your administrator gave you (section 1.2).
2. **Look at the Dashboard.** Red and amber tiles are the records that need you (section 2).
3. **Open Documents** and find one of your records with the search box (section 3.1).
4. **Open My Alerts** to see which records will email you, and why (section 5.4).
5. **Click Logout** when you finish, especially on a shared computer.

I want to...

I want to	Go to
Add a new document	Section 3.3
Let the system read a scanned file and fill the form	Section 3.4 (documents), 4.4 and 4.5 (employees)
Renew a license that is about to expire	Section 3.5 (documents), 4.6 (employee licenses and checkups)
Email someone about a document right now	Section 3.10
Add an employee, a license or a health checkup	Sections 4.2, 4.4 and 4.5
Find out why I did, or did not, get an email	Sections 5.4 to 5.6
Add a user or change who gets alerts (administrators)	Sections 6.2 to 6.4
Take or download a backup (Super Admin)	Section 6.7
Fix a problem	Section 8

How the manual marks things

Tip
A shortcut or a habit that saves time.

Note
Something worth knowing about how the system behaves.

Important
Read this before you continue. A mistake here is easy to make.

Administrators
Only for administrators. Other roles will not see these screens.

The screens in this manual use made-up demo data. Your own factory, people and records will look different, and your menu may show fewer items than the pictures, depending on your role.

1. Getting started

1.1 What DocMan Alert does

Ananta's factories hold many documents that expire: fire licenses, trade licenses, boiler certificates, environmental clearances, audit certificates. People also hold licenses of their own, such as an electrician's license, and take health checkups on a schedule. Miss one date and a factory can be fined or stopped. DocMan Alert exists so that does not happen.

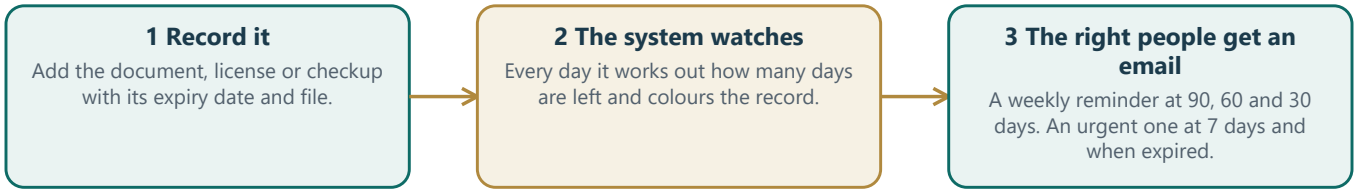

Figure 1. The whole idea in three steps.

You can think of three kinds of record: **Factory Documents** (under Documents), **Employee Licenses** and **Health Checkups** (both under Employee Compliance). All three work the same way: an expiry date drives a colour-coded status and a schedule of emails.

1.2 Signing in

Open the web address your ICT team gave you. If you are not signed in you will always land on this page.

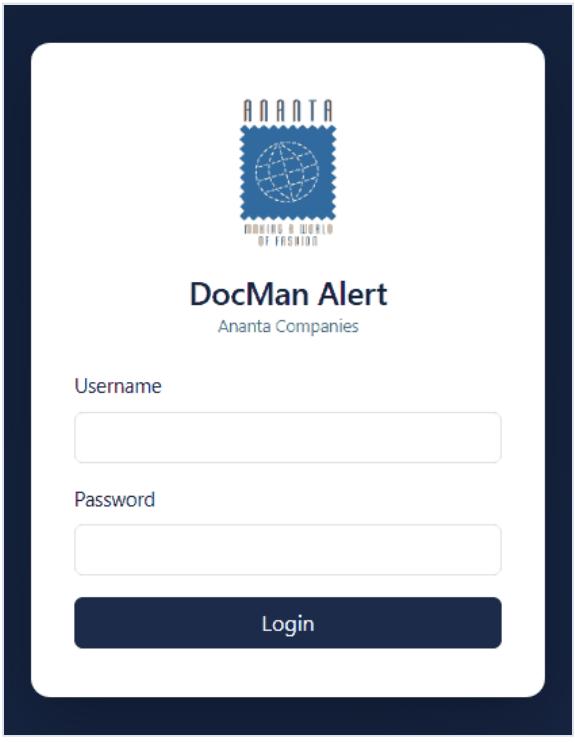

Figure 2. The sign-in page.

1. Type your **Username**.
2. Type your **Password**. Passwords are case sensitive.
3. Click **Login**. You arrive on the Dashboard.

> **Note**
> Five wrong passwords in a row lock your account for **10 minutes**. Wait and try again. Nobody needs to unlock it. The lock survives a restart of the system, so closing the browser does not help.

> **Tip**
> Forgot your password? Ask your Factory Admin or the ICT team to set a new one. Passwords are never emailed; your administrator will tell you the new one directly.

To leave, click **Logout** at the top right. Your session also ends when you close the browser. There is no automatic timeout while the browser stays open, so log out on shared computers.

1.3 Finding your way around

Every page has the same frame: a menu on the left, a bar at the top, and the working area in the middle.

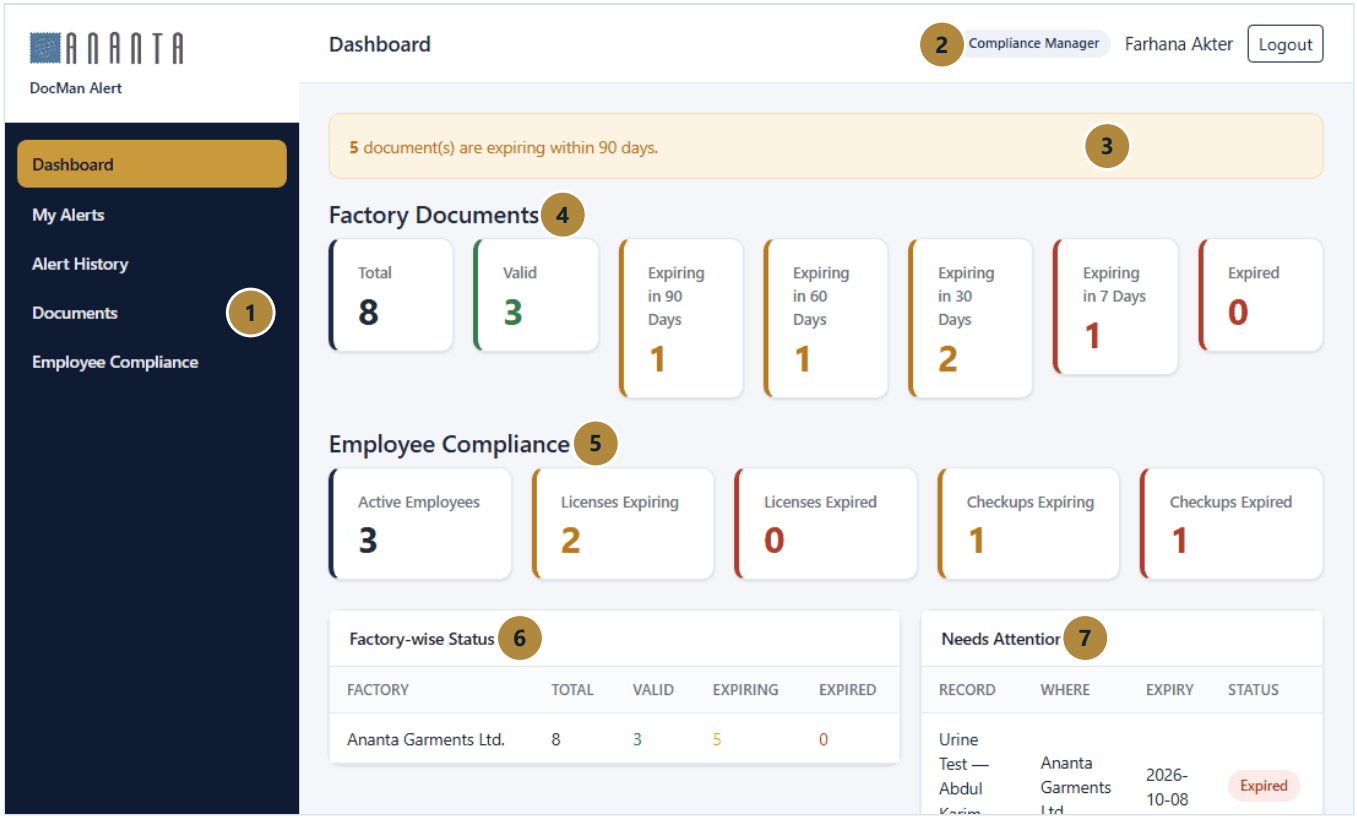

Figure 3. The Dashboard as a Compliance Manager sees it.

1. **Menu.** Shows only the pages your role may open. The highlighted item is where you are.
2. **Who you are.** Your role and name, with the Logout button.
3. **Warning banner.** Appears when documents have expired or are expiring within 90 days.
4. **Factory Documents tiles.** How many documents are in each status.
5. **Employee Compliance tiles.** Active employees, and licenses and checkups that are expiring or expired.
6. **Factory-wise Status.** The same counts for each factory you can see.
7. **Needs Attention.** The most urgent records. Click a name to open it.

What the menu items are for:

Menu item	Use it to
Dashboard	See where things stand across your factories.
My Alerts	See which records will email you, and why.
Alert History	See every alert email the system has sent, or failed to send.
Documents	Manage factory documents and certificates.

Menu item	Use it to
Employee Compliance	Manage employees, their licenses and health checkups. Two shortcuts appear underneath: Employee Licenses and Health Checkups.
Companies, Factories, Departments, Dept. Alert Recipients, Users	Administration (section 6).
Categories, Regulatory Authorities, Services, Backups, System Logs	Super Admin only (section 6).

1.4 Your role decides what you can do

Every account has one **role** and, for most roles, one **factory**. The role decides which buttons exist. The factory decides which records you can see. A person at Ananta Garments will not see another factory's documents unless their role covers every factory.

Role	Sees	Can do
Super Admin	All factories	Everything: all records, users, factories, companies, regulatory lists, Excel import, backups and System Logs.
Administration	All factories	Add, edit, renew, archive and delete documents; add and edit employees and archive their licenses and checkups; link documents to a regulatory service; view companies and departments and set who receives their alerts.
Factory Admin	Own factory	Everything a Compliance Manager can do, plus manage users of the factory, departments and recipients.
Compliance Manager	Own factory	Add, edit, renew, archive, restore and delete documents; add, edit and archive employee licenses and checkups.
Compliance User	Own factory	Add, edit and renew. Cannot archive or delete.
Compliance Viewer	All factories	Look at everything. Cannot change anything.
Transport Manager	Own factory	Same rights as Compliance Manager, for the Transport department.
Transport User	Own factory	Same rights as Compliance User, for the Transport department.

> **Tip**
> A button or menu item you expected is missing? That is your role at work, not a fault. If you believe your role is wrong, ask your Factory Admin.

1.5 What the status colours mean

Every record carries one of six statuses. The system works them out from the expiry date, in Bangladesh time, and refreshes them every morning and whenever you save or open the Dashboard.

Status	What it means	Email
Valid	More than 90 days left, or the record has no expiry date.	No email.
Expiring in 90 Days	61 to 90 days left.	Weekly reminder.
Expiring in 60 Days	31 to 60 days left.	Weekly reminder.
Expiring in 30 Days	8 to 30 days left.	Weekly reminder.
Expiring in 7 Days	1 to 7 days left.	Urgent email.
Expired	The expiry date is today or has passed.	Urgent email.

Colours are the same everywhere: green is fine, amber is coming up, red and pink need action now.

2. The Dashboard

The Dashboard is the first page after sign-in and the best place to start each day. It counts only **active** records in the factories you can see. Archived records are left out.

Area	What it shows
Warning banner	How many documents have already expired and how many expire within 90 days.
Factory Documents	Total, Valid, Expiring in 90, 60, 30 and 7 Days, and Expired, for factory documents.
Employee Compliance	Active employees; employee licenses that are expiring or expired; health checkups that are expiring or expired. "Expiring" counts all four expiring bands together.
Factory-wise Status	One row per factory with Total, Valid, Expiring and Expired documents.
Needs Attention	Up to 12 records that are Expired or Expiring in 7 Days, soonest first. Expired ones come first. Click a name to open the document or the employee.

> **Note**
> Opening the Dashboard refreshes the statuses, so the numbers are always up to date. It never sends an email.

3. Factory documents

Documents are the certificates and licenses a factory or department holds: fire license, trade license, boiler certificate, environmental certificate, audit reports and so on. Each document has one current record and any number of stored files, one per version.

3.1 Find a document

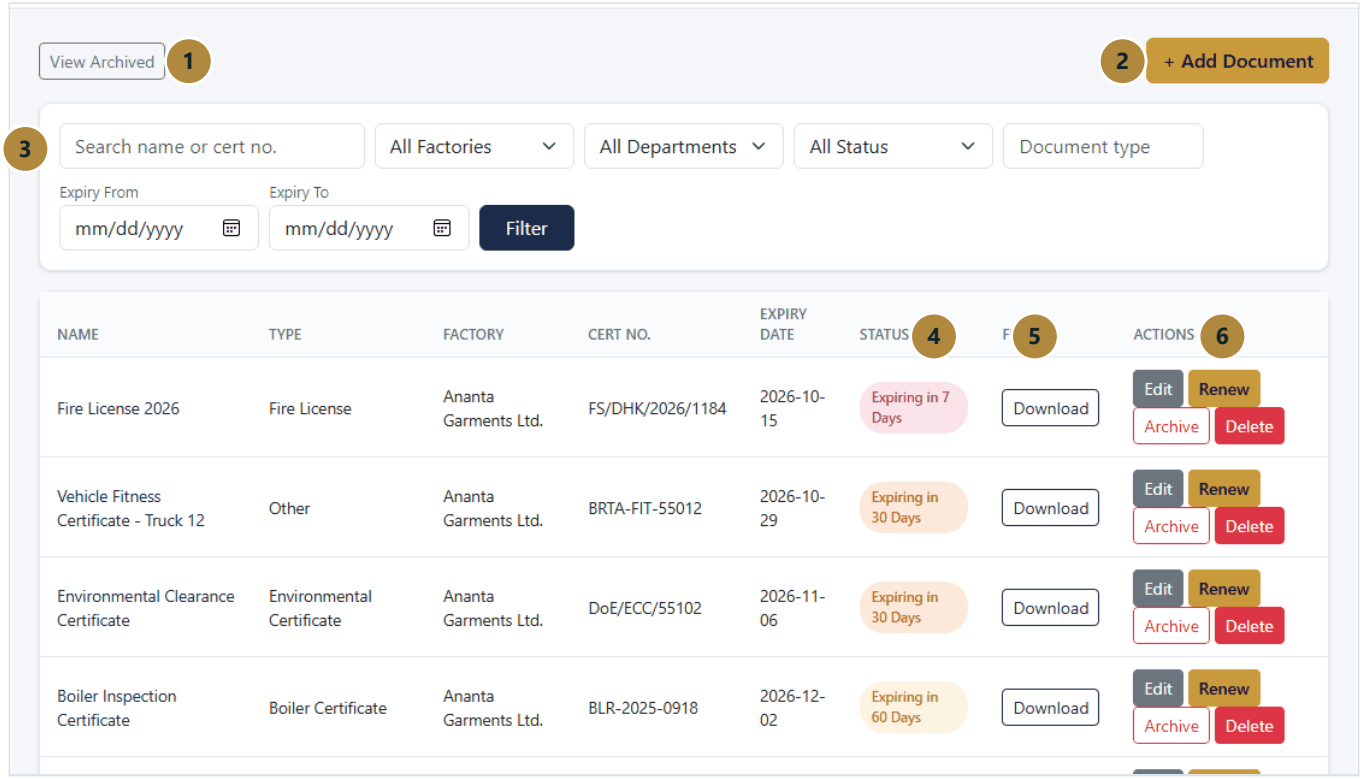

Figure 4. The Documents page.

1. **View Archived.** Switches to documents that were archived.
2. **+ Add Document.** Only shown if your role may add records.
3. **Search and filters.** Name, certificate number, text inside the file, factory, department, status, document type and an expiry date range.
4. **Status.** The coloured label from section 1.5.
5. **Download.** Gets the latest file.
6. **Actions.** Edit, Renew, Archive and Delete, depending on your role.

- The list shows 10 documents per page, soonest expiry first. Documents with no expiry come last.
- The search box also looks **inside** the text read from scanned files, so you can search for a licence number that only appears in the PDF.
- Click **Filter** to apply your choices. Your filters stay in the page links while you move between pages.
- You only see the factories your account covers.

3.2 Open a document

Click a document's name. The detail page shows everything about it and who will be emailed.

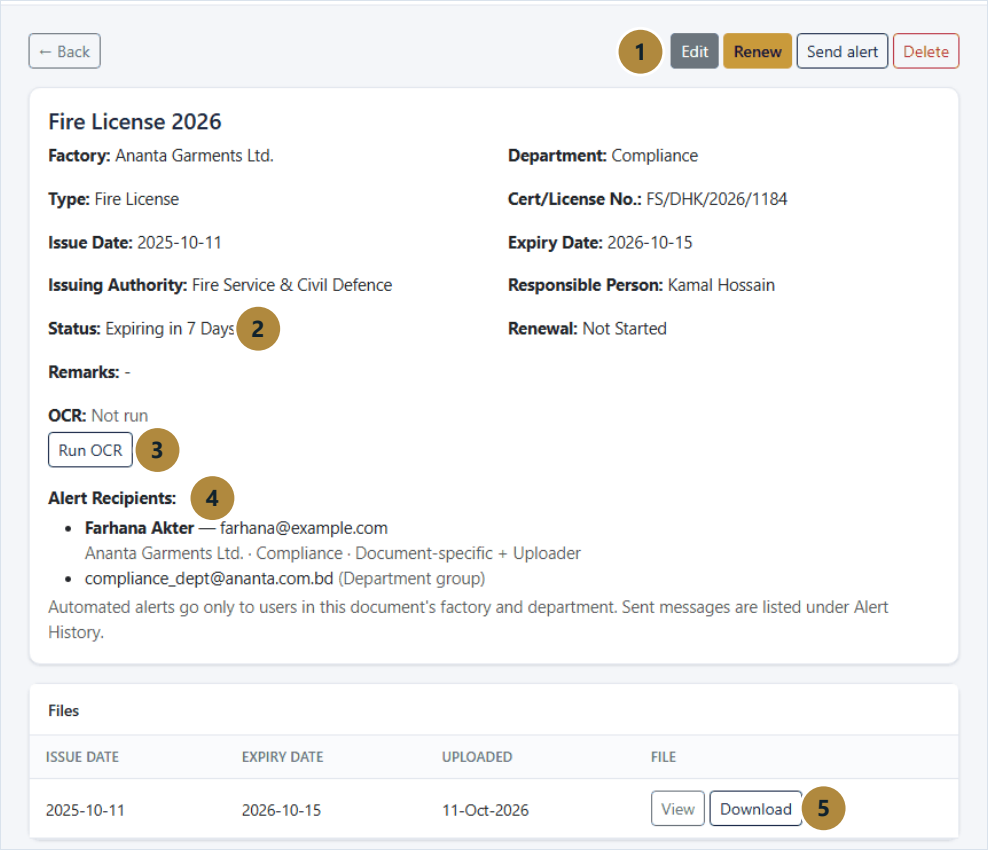

Figure 5. A document's detail page.

1. **Action buttons.** Edit, Renew, Send alert and Delete.
2. **Status.** Worked out from the expiry date.
3. **OCR.** Run OCR reads the stored file and suggests details (section 3.9).
4. **Alert Recipients.** Exactly who will be emailed for this document, and why.
5. **Files.** One line per version. View opens the file; Download saves it.

3.3 Add a document

1. On the Documents page click **+ Add Document**.
2. Choose the **Factory** and the **Department**.
3. Enter the **Document Name**, **Document Type** and **Certificate/License No.**
4. Enter the **Issue Date** and **Expiry Date**, or tick **This document has no expiry date**.
5. Fill in Issuing Authority and Responsible Person if you know them.
6. Tick the people who should be emailed (optional, see section 5.3).
7. Attach the file and click **Save**.

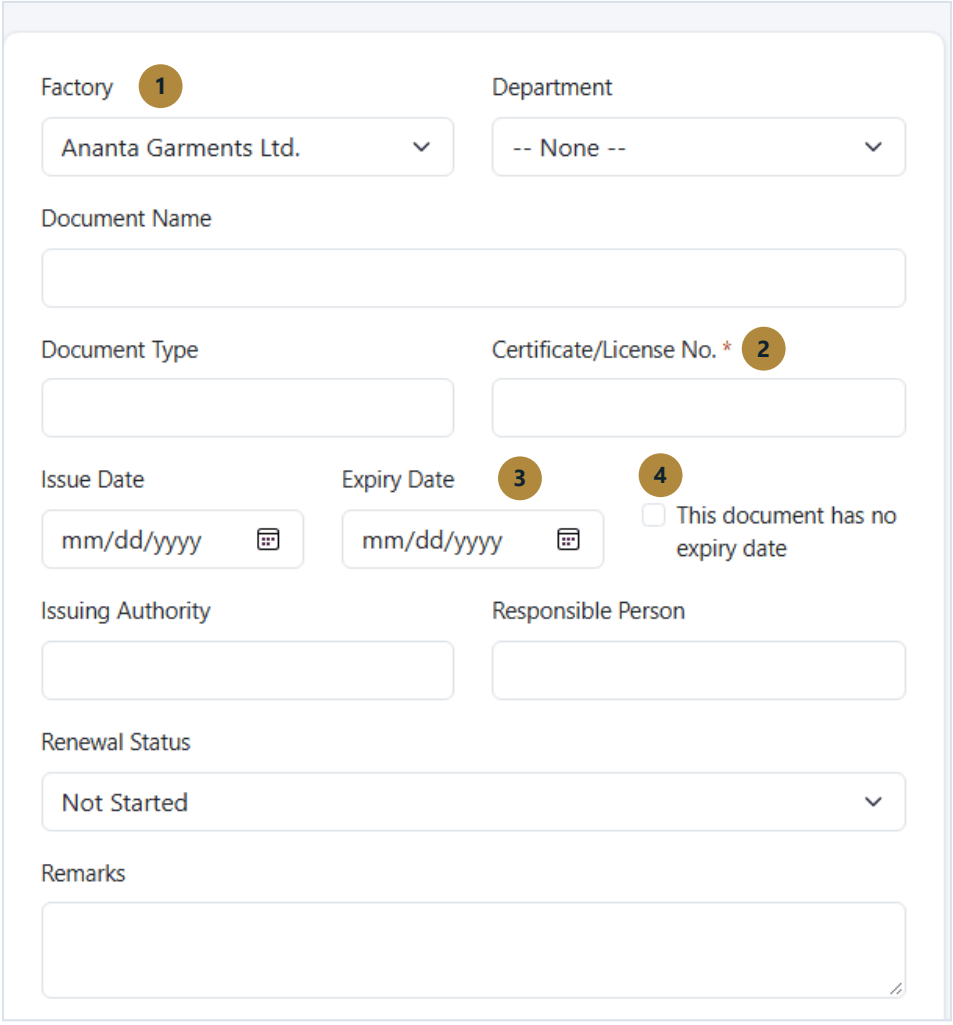

Figure 6a. The Add Document form, top half.

1. Factory and department. The recipient list further down depends on both.
2. Certificate or license number. The star means it is required.
3. Issue and expiry dates.
4. No expiry. Tick this for documents that never expire; the expiry box switches off.

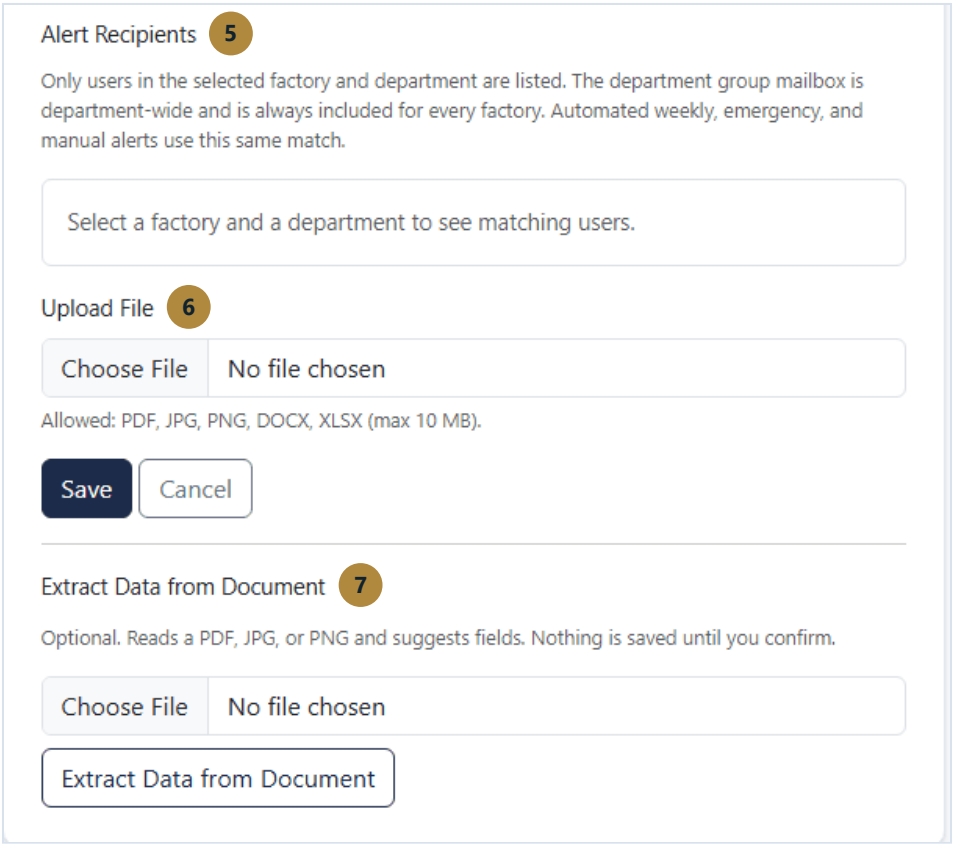

Figure 6b. The same form, bottom half.

5 Alert recipients. People of this factory and department, plus the department's group mailbox.

6 Upload the file here. PDF, JPG, PNG, DOCX or XLSX, up to 10 MB.

7 Or let the system read a file for you (section 3.4).

Field	What to enter	Needed?
Factory	The factory that holds the document. You only see your own factory unless your role covers all.	Yes
Department	The department responsible. Alerts are matched by department, so set it.	Strongly advised
Document Name	A name people will recognise, for example Fire License 2026.	Yes
Document Type	Start typing and pick a suggestion (Fire License, Trade License, Boiler Certificate, Environmental Certificate, Factory License, Amfori BSCI, WRAP, Sedex, Other) or type your own.	Yes
Certificate/License No.	The number printed on the document.	Yes
Issue Date, Expiry Date	Dates on the document. Expiry cannot be earlier than issue.	Expiry or No expiry
Issuing Authority	The office that issued it.	No
Responsible Person	The person who looks after it. Text only; this does not send email.	No
Renewal Status	Not Started, In Progress or Completed. Use it to track a renewal.	No
Remarks	Anything worth remembering.	No
Category, Authority, Service	Links the document to a government office and service. Only Super Admin and Administration see these.	No
Alert Recipients	Specific people to email (section 5.3).	No

Field	What to enter	Needed?
Upload File	The scan or file itself.	Advised

Important
Always set an expiry date **or** tick No expiry. If you leave both empty the document is saved as Valid with no expiry, and the system will never send an alert for it.

Tip
Set the department every time. The system emails only people who belong to the document's factory **and** department, so a document with no department reaches far fewer people.

3.4 Let the system fill the form for you

Typing every detail is slow. If you have a PDF, JPG or PNG of the document, the system can read it and suggest the name, number, authority and dates. It works with printed text in English and Bangla.

1. On the **Add Document** page scroll to **Extract Data from Document**.
2. Choose the file and click **Extract Data from Document**. Scans take a few seconds.
3. A **Confirm Extracted Data** page opens with the form already filled in.
4. Check every field. Correct anything that is wrong. Fill the ones left empty.
5. Click **Confirm & Save**, or **Cancel** to throw everything away.

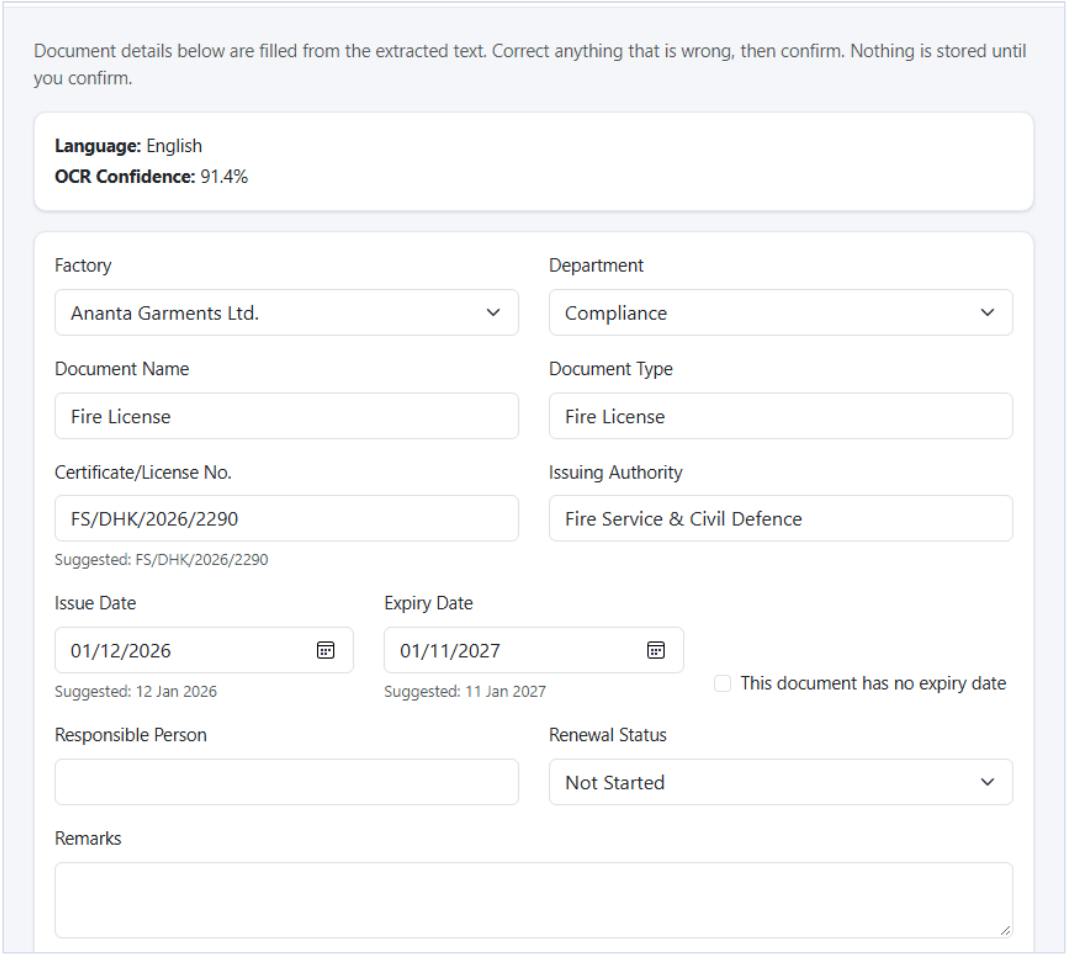

Figure 7. Confirming extracted data (top of the page). Grey "Suggested" notes show what was read from the file; the extracted text sits below the form.

Important
The suggestions are a starting point, not a result. Nothing is saved until you click Confirm & Save, and you are responsible for the final values. A low confidence warning means the scan was hard to read: check every field slowly.

Note
A date such as 05/06/2026 could be 5 June or 6 May, so the system will not guess. It leaves the date for you to type. Dates written like 12 Jan 2026 or 2026-01-12 are read correctly.

3.5 Renew a document

When a new license arrives, do not create a second document. Renew the existing one so the history stays together.

1. Open the document and click **Renew** (also available in the list).
2. Enter the new **Issue Date** and **Expiry Date**, or tick No expiry.
3. Update the **Certificate/License No.** if it changed, and add remarks if useful.
4. Attach the new file and click **Create New Version**.

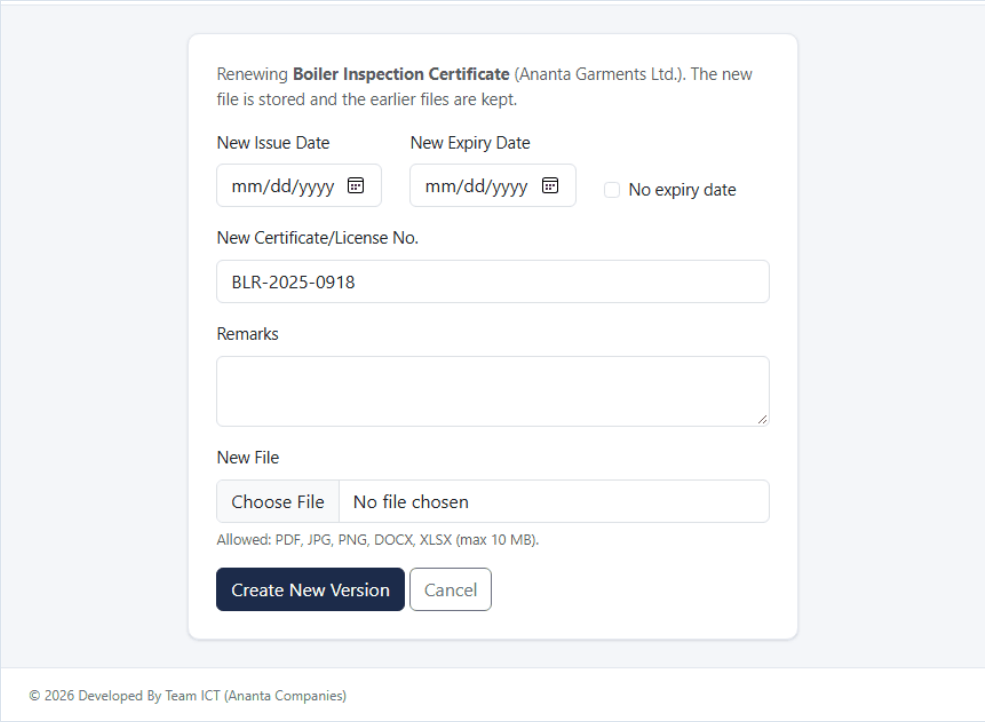

Figure 8. The Renew page.

What happens: the new file becomes the next version, the old file stays available in the document's Files list, the status is recalculated from the new expiry date, and Renewal Status becomes **Completed**. Because the expiry date is new, alerts start fresh for it.

> **Important**
> Fill in the new expiry date. A renewal saved with both the expiry date and No expiry left empty clears the expiry and the document shows Valid.

3.6 Edit a document

Click **Edit**, change what you need and click **Save**. The status and future alerts update at once. If you attach a file while editing, it is stored as a new version and the old one is kept.

3.7 View and download files

On the detail page, **View** opens the file in a new tab and **Download** saves it. Every version is listed with its issue date, expiry date and upload date, newest first. In the Documents list the Download button always gets the latest version.

3.8 Archive, restore and delete

Action	What happens	Can it be undone?	Who
Archive	The document leaves the active list and the Dashboard, and stops sending alerts. Files are kept.	Yes: View Archived, then Restore.	Managers and above
Restore	Brings an archived document back to the active list.	-	Managers and above
Delete	Removes the document, all its versions and files for good. Alert History keeps the record of emails already sent.	No.	Managers and above

"Managers and above" means Super Admin, Administration, Factory Admin, Compliance Manager and Transport Manager. Compliance User and Transport User cannot archive or delete.

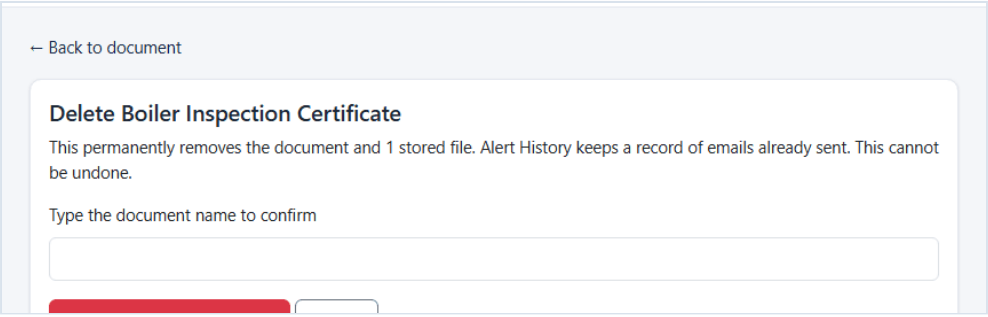

Figure 9. Delete asks you to type the exact document name.

Careful
Delete cannot be undone. If you only want a document out of the way, use Archive instead.

3.9 Run OCR on a stored file

You can also read a file that is already attached. On the document's detail page, find the OCR line and click **Run OCR**. When it finishes click **View Extracted Text**.

1. Read the **Suggested fields**: certificate number, issuing authority, issue date, expiry date.
2. Tick **Apply** next to each value you want to save. Nothing is applied unless you tick it.
3. Fix the extracted text if you wish; it is what the search box looks at.
4. Click **Confirm**.

OCR works on PDF, JPG and PNG files up to 10 MB and 50 pages. If the reading engine is not installed on the server you will see "OCR is currently unavailable"; everything else keeps working.

3.10 Send an alert right now

The system already emails people on its own schedule (section 5). Use **Send alert** when you want to nudge someone today, for example to chase a renewal.

1. Open the document and click **Send alert**.
2. Tick the people and the group mailbox you want to reach.
3. Click **Send this alert**.

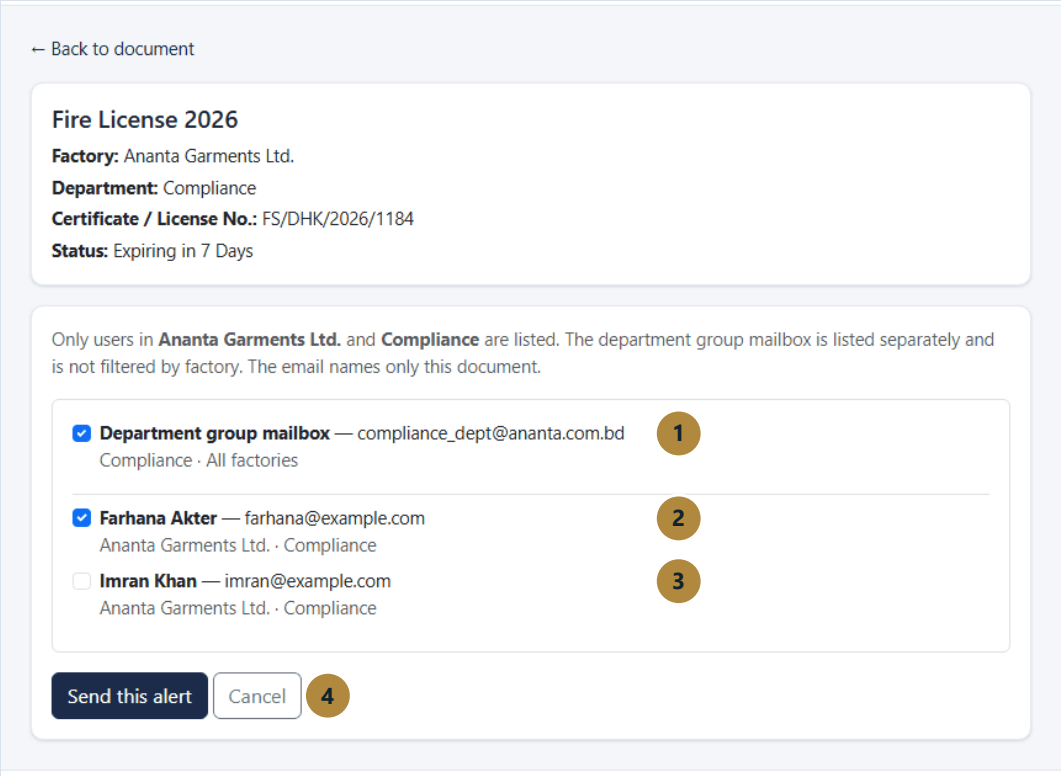

Figure 10. Choosing who to alert.

1. The department's group mailbox. Ticked by default.
2. A person in this document's factory and department. Ticked people receive the email.
3. An unticked person. They will not receive this one.
4. Send. The result shows at the top of the next page and in Alert History.

> **Note**
> The people you tick are also saved as this document's alert recipients, replacing the earlier ones. Future automatic alerts will go to them first. A manual alert is an extra email; it does not cancel the automatic ones.

4. Employee compliance

This part tracks people: who works where, which licenses they hold, and when their health checkups expire. It follows the same ideas as documents, with one extra layer, the employee.

4.1 The employee list

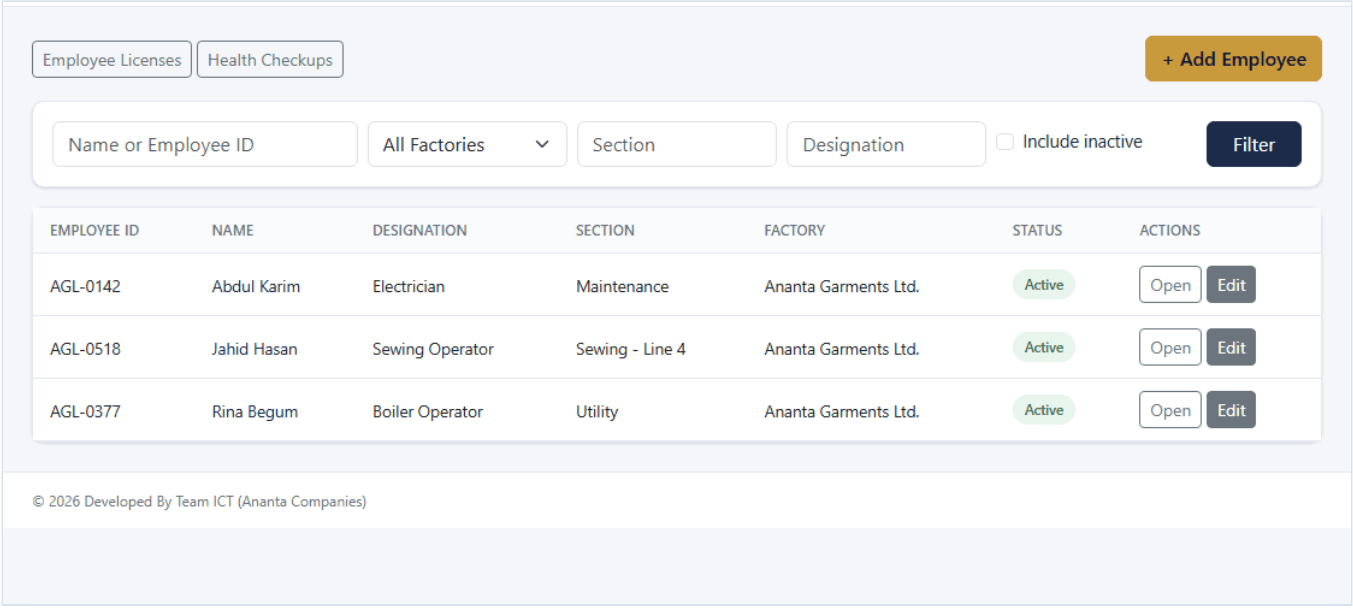

Figure 11. Employee Compliance. Search by name or Employee ID, and filter by factory, section or designation.

Inactive employees are hidden unless you tick **Include inactive**. The two buttons on the left take you to cross-employee lists of licenses and health checkups (section 4.8). **Import** appears for Super Admin only (section 4.9).

4.2 Add or edit an employee

1. Click **+ Add Employee**.
2. Enter the **Employee ID**, **Name**, and, if you have them, Designation and Section.
3. Choose the **Factory** and **Department** and enter the Date of Joining.
4. Add an **Email** only if this person should receive alerts about their own records. Then tick **Send alerts to this employee**.
5. Leave Status on **Active** and click **Save**.

Field	Notes
Employee ID	The number from HR. Must be unique within the factory.
Department	Used to decide who is emailed about this person's licenses and checkups.
Email and Send alerts	The person's own address is used only when both are set and the address is valid. Otherwise their personal email is never used.
Status	Set Inactive when someone leaves. Employees are never deleted, so history is kept.

4.3 The employee page

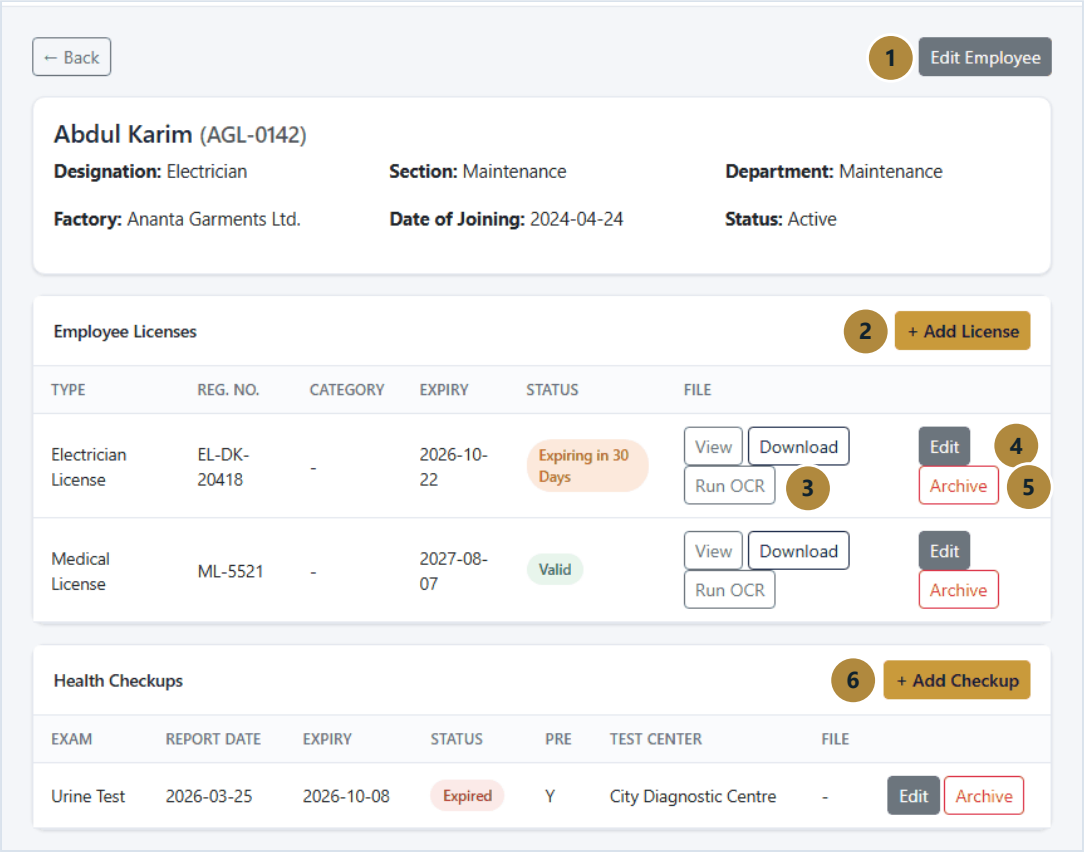

Figure 12. An employee with licenses and health checkups.

1. **Edit Employee.**
2. **+ Add License.**
3. **Run OCR** reads the attached file and suggests details. Once run, this shows **OCR** to review the result.
4. **Edit** a license; use it to change dates or attach a newer file.
5. **Archive** hides a record that no longer applies.
6. **+ Add Checkup.**

4.4 Add an employee license

Licenses are things a person holds personally: electrician license, medical license, boiler operator license. Open the employee and click **+ Add License**.

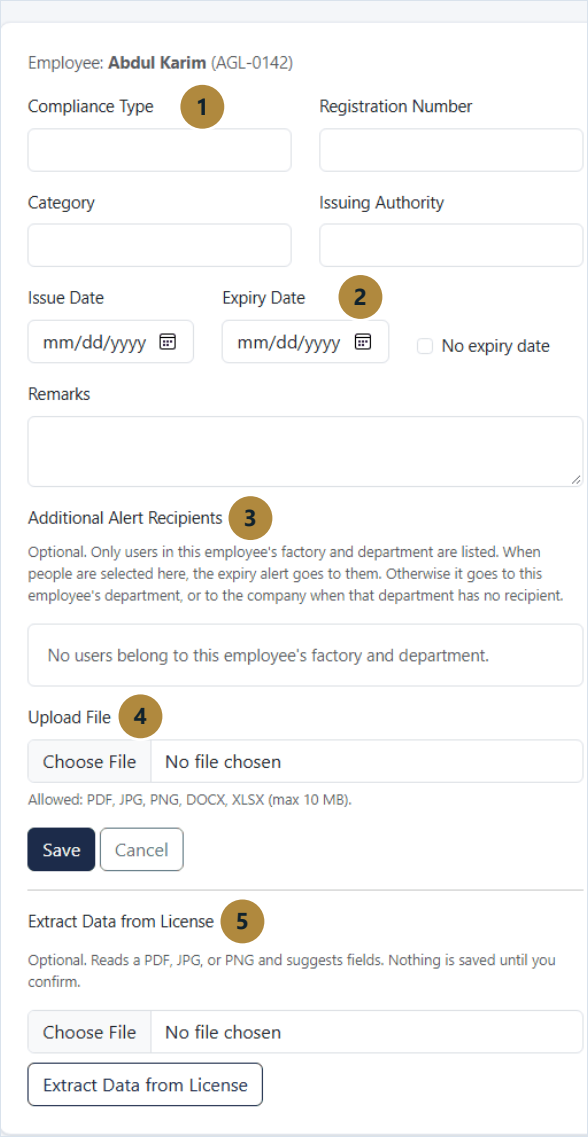

Figure 13. The Add License form.

1. Compliance Type. Type your own or pick Electrician License, Medical License, Boiler Operator License.
2. Issue and expiry dates, or No expiry date.
3. Additional Alert Recipients. Optional. People of the employee's factory and department.
4. Upload the file.
5. Or extract the details from a PDF, JPG or PNG (works like section 3.4).

Registration Number, Category and Issuing Authority are optional text fields. The recipients list works like it does for documents: people ticked here are emailed first; otherwise the employee's department, then the company (section 5.3).

4.5 Add a health checkup

Open the employee and click **+ Add Checkup**. Each exam is its own record, so one person can have four, each with its own expiry date.

Field	What to enter
Exam Type	CBC, Hearing / Widal, Chest X-Ray P/A or Urine Test.

Field	What to enter
Report Date	The date on the medical report.
Expiry Date or No expiry	When the checkup must be repeated.
PRE (Y/N)	Pre-employment checkup: Y or N.
Test Center	Where it was done.
Additional Alert Recipients, file	Same as for licenses. You can also extract the details from the report.

4.6 Renew a license or a checkup

There is no separate Renew button here. Click **Edit** on the record, enter the new dates and attach the new file. The new file becomes the next version; links such as **v1** and **v2** appear in the File column so the earlier files stay reachable.

4.7 Archive a license or checkup

Click **Archive** on the record. It disappears from the employee page, the lists and the Dashboard and stops sending alerts. There is no Restore button for these records, so ask your administrator or ICT if you archived one by mistake. Compliance Users see the button, but the system refuses the action for them.

4.8 Licenses and checkups across all employees

Employee Licenses and **Health Checkups** (under Employee Compliance in the menu) list every record in your factories, soonest expiry first, 15 per page.

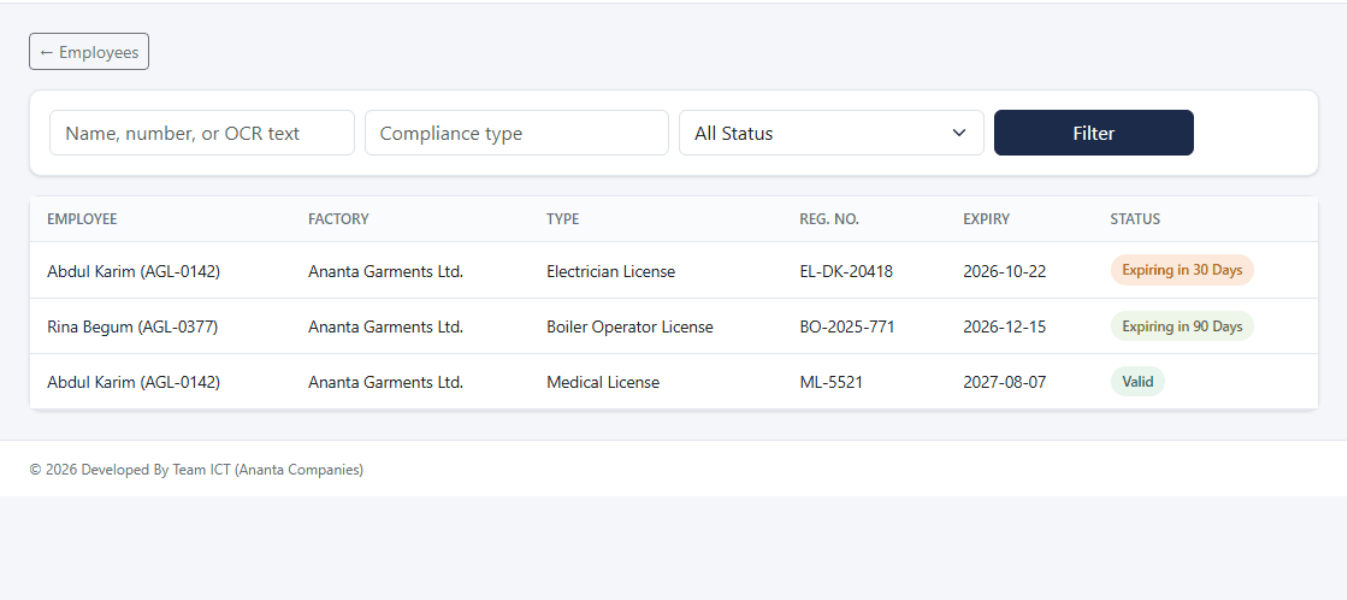

Figure 14. All employee licenses. Search by registration number, employee name or text in the file.

4.9 Import many employees from Excel

> **Administrators**
> Super Admin only.

Importing is for onboarding or moving data from spreadsheets. You always see a preview first, and nothing is saved until you confirm.

1. Go to **Employee Compliance** and click **Import**.

2. Choose an **Import Type**: Employees, Employee Licenses, Medical Licenses, Health Checkups, Alert Recipients, or Full Workbook.
3. Choose your **.xlsx** file and click **Upload & Preview**.
4. Read the preview. Valid rows will be imported; warnings are skipped duplicates; failed rows say why.
5. Click **Confirm Import**, or Cancel.

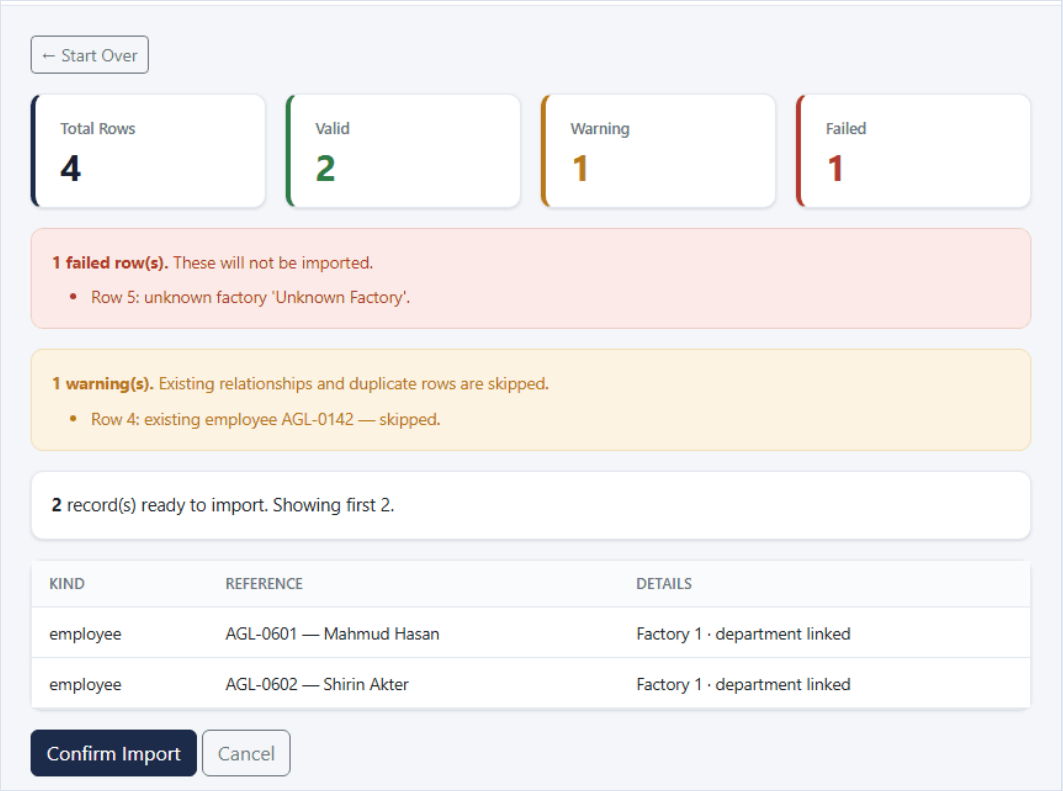

Figure 15. An import preview: 2 rows ready, 1 skipped duplicate, 1 failed.

Import type	Columns it needs
Employees	Employee ID, Employee Name, Factory. Optional: Designation, Section, Company, Department, Date of Joining, Email.
Employee Licenses, Medical Licenses	Name, ID No (or Employee ID), Factory. Optional: Designation, Section, Registration No, Category, Issue Date, Expiry Date, Remarks.
Health Checkups	Employee ID, Name, Factory, plus report and expiry columns for CBC, Hearing / Widal, Chest X-Ray and Urine Test. Optional: PRE Y/N, Test Center, DOJ.
Alert Recipients	Company, Recipient Scope (COMPANY or DEPARTMENT) and Username or Email. Department is needed for scope DEPARTMENT.
Full Workbook	One file with sheets named Employees, Employee Licenses, Medical Licenses, Health Checkups and Alert Recipients.

- Companies, factories, departments and users must already exist. Unknown ones are reported and never created.
- Dates can be real Excel dates, 2026-01-12, 12-01-2026 or 12-Jan-2026. Cells that say Till Now, N/A, Permanent or a dash become *no expiry*.
- Rows that already exist are skipped, so importing the same file twice does no harm.

5. Alerts and emails

You never have to remember to send reminders. The system does it. This section explains when, to whom, and where you can check afterwards.

5.1 When emails are sent

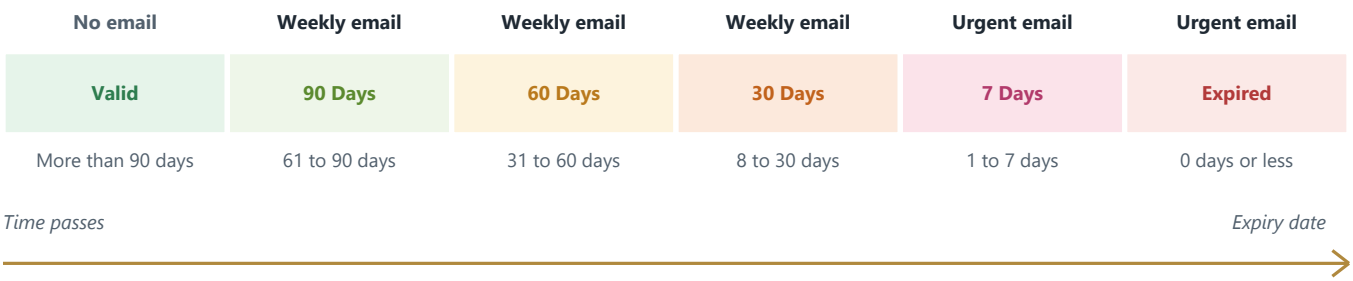

Figure 16. A record moves from left to right as its expiry date approaches.

Email	When	Which records	Repeats?
Weekly reminder	Every Saturday at 09:00	Expiring in 90, 60 or 30 Days	Every week while the record stays in those bands.
Urgent alert	Every day at 09:00	Expiring in 7 Days, or Expired	Once for each status. You get one when it reaches 7 days and one when it expires, not one every morning.
Manual alert	When someone clicks Send alert	One document	Each time it is sent.

One email is about **one record**. If three of your records are expiring this week you will receive three separate emails, each easy to act on and to file.

> **Note**
> After a renewal the expiry date is new, so the urgent alert can fire again in the next cycle. Times are Bangladesh Standard Time.

5.2 What an email looks like

From document_tracker@ananta.com.bd
To Farhana Akter
Subject **URGENT: Fire License 2026 Expires in 4 Days**

Dear Recipient,

Scheduled urgent alert for this document. It goes to the assigned person, or to the document's department, or to the company when that department has no recipient.

Document:	Fire License 2026
Document Type:	Fire License
Certificate / License No.:	FS/DHK/2026/1184
Company:	Ananta Companies
Factory:	Ananta Garments Ltd.
Department:	Compliance
Issue Date:	11-Oct-2025
Expiry Date:	15-Oct-2026
Remaining:	4 Days
Alert Status:	Expiring in 7 Days

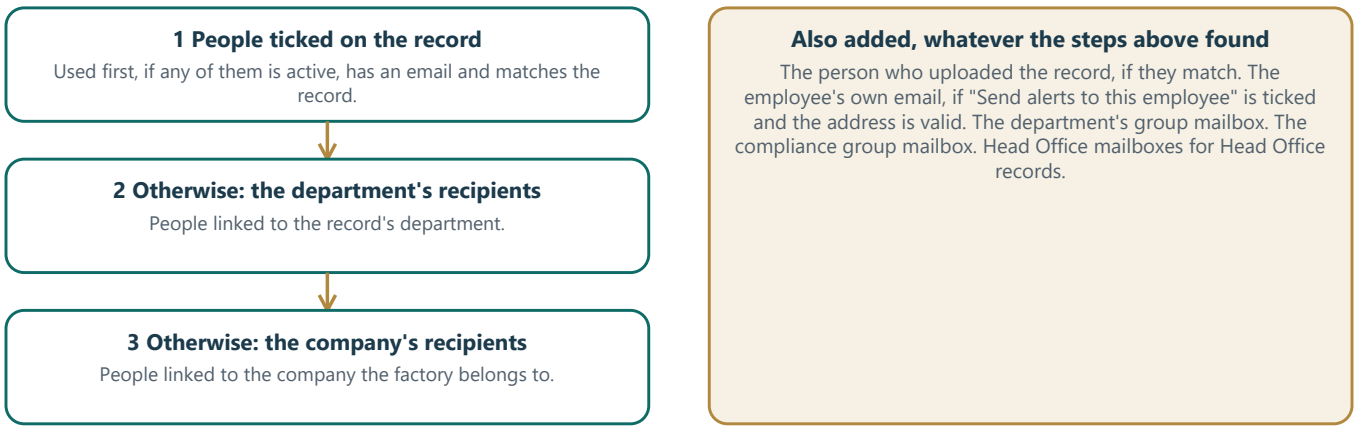

This message is only about the record above. Please take the necessary action.

Regards, Ananta DocMan Alert

Figure 17. An urgent alert. Weekly and manual emails use the same layout.

Subjects tell you the situation at a glance: **Compliance Alert: ... - Expiring in 30 Days** for the weekly reminder, **URGENT: ... Expires in 4 Days** or **URGENT: ... Expired** for urgent alerts, and **Compliance Notice: ...** for a manual one.

5.3 Who gets the email

Everyone above must belong to the record's factory and department to be emailed.
Figure 18. How the system chooses recipients for a record.

The system goes down the three boxes on the left and stops at the first one that has at least one valid person. Then it adds the extras on the right. A person is only emailed when their account is active, has a valid email address, and belongs to the same **factory and department** as the record.

> **Tip**
> Two quick checks explain most surprises: does the person's account have the right factory and department, and does it have an email address?

An example: a Fire License belongs to Ananta Garments, department Compliance. Farhana uploaded it and is ticked on it. Imran is a Compliance department recipient. The email goes to Farhana and to the compliance group mailbox. Imran is skipped, because a person was ticked on the document. Untick everyone and the email goes to the department's recipients instead, which includes Imran.

5.4 My Alerts

My Alerts answers "what am I responsible for?" It lists the records that will really send you an email, and says why.

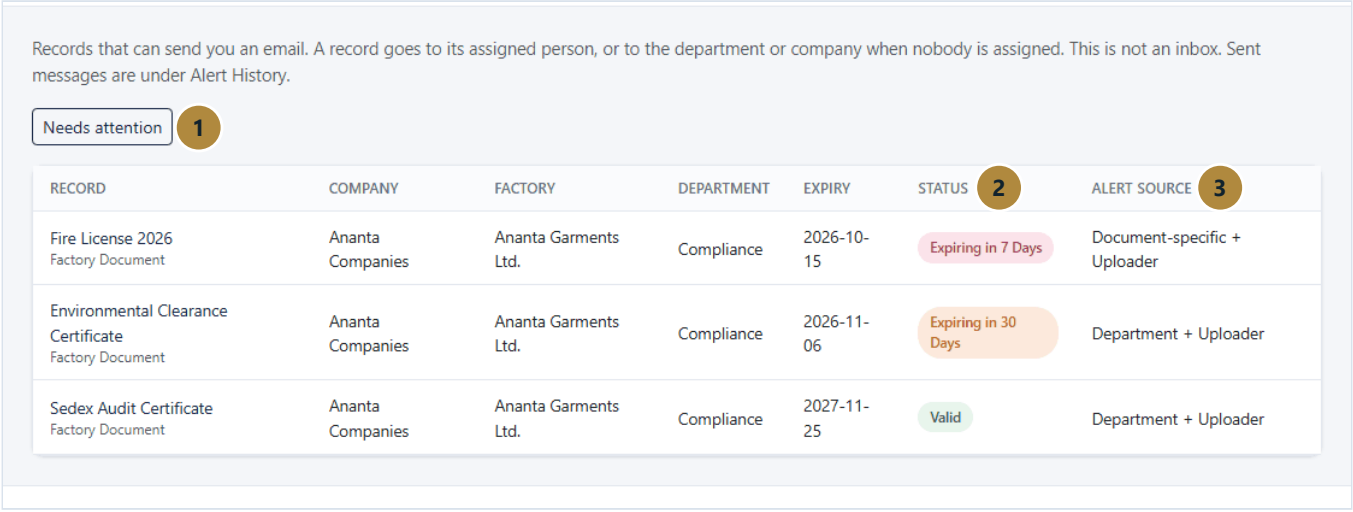

Figure 19. My Alert Responsibilities.

1. Switch between records that need attention and **all** your responsibilities.
2. The record's current status.
3. **Alert source**: Document-specific, Department, Company or Uploader. This is the reason you are on the list.

My Alerts is not an inbox. It shows up to 200 records per kind, soonest expiry first. Messages already sent are in Alert History.

5.5 Alert History

Alert History lists every alert email the system handed to the mail server, including the ones that failed. You see the factories you can access.

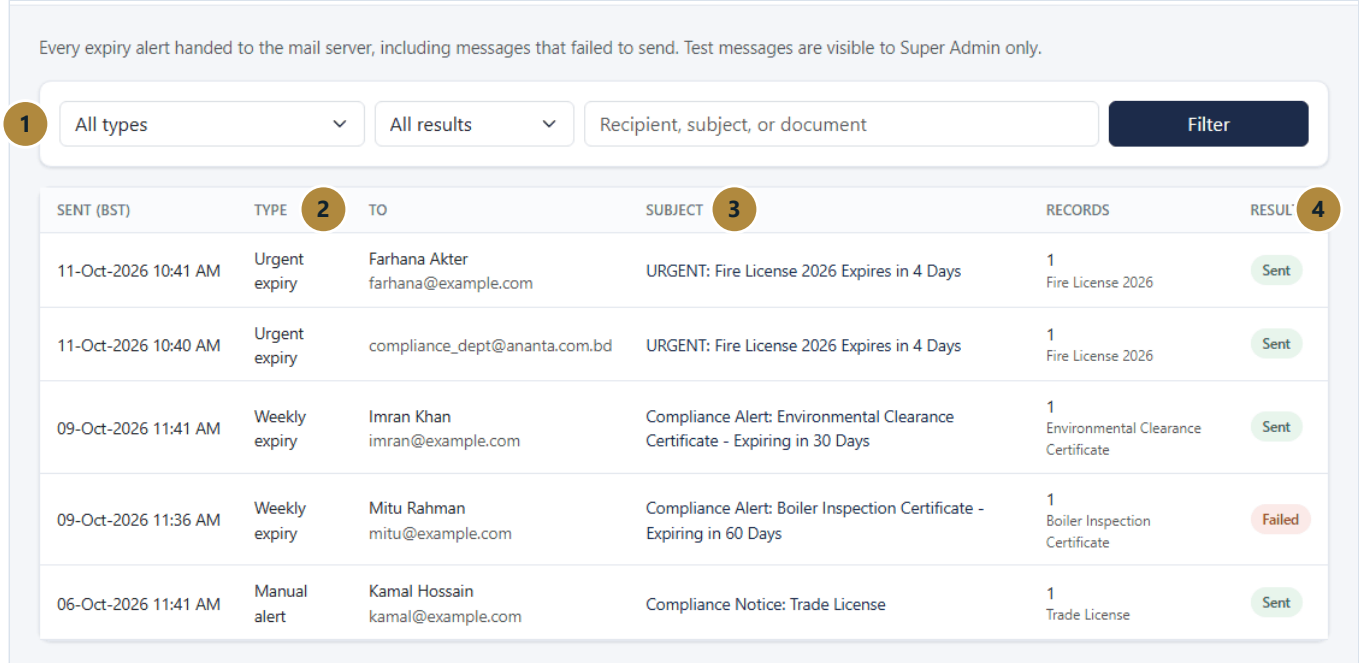

Figure 20. Alert History.

1. Filter by type (Weekly, Urgent, Manual), by result, or search a recipient, subject or document name.
2. **Type** of alert.
3. **Subject.** Click it to see which record the email covered and why this person received it.
4. **Result.** Sent, or Failed if the mail server could not deliver.

5.6 "I did not get an email"

Work through this list in order. Most cases are solved by the first three.

1. **Check the status.** Weekly mail only goes for Expiring in 90, 60 and 30 Days. Urgent mail only for 7 Days and Expired. A Valid record sends nothing.
2. **Check the day.** Weekly reminders go out on Saturday morning; urgent ones at 09:00 each day.
3. **Open Alert History** and search for your name or the document. It shows who the system tried to reach and whether it worked.
4. **Open My Alerts** with Show all responsibilities. If the record is not listed, you are not a recipient.
5. **Check your account.** It needs a valid email address, to be active, and the same factory and department as the record. Ask your Factory Admin to check.
6. **Check the junk folder.** Mail comes from document_tracker@ananta.com.bd.
7. If History says **Failed**, the mail server was unreachable. Tell ICT.

6. Administrator guide

> **Administrators**
> This section is for Super Admin, Administration and Factory Admin. Some screens belong to Super Admin only; each heading says who may use it.

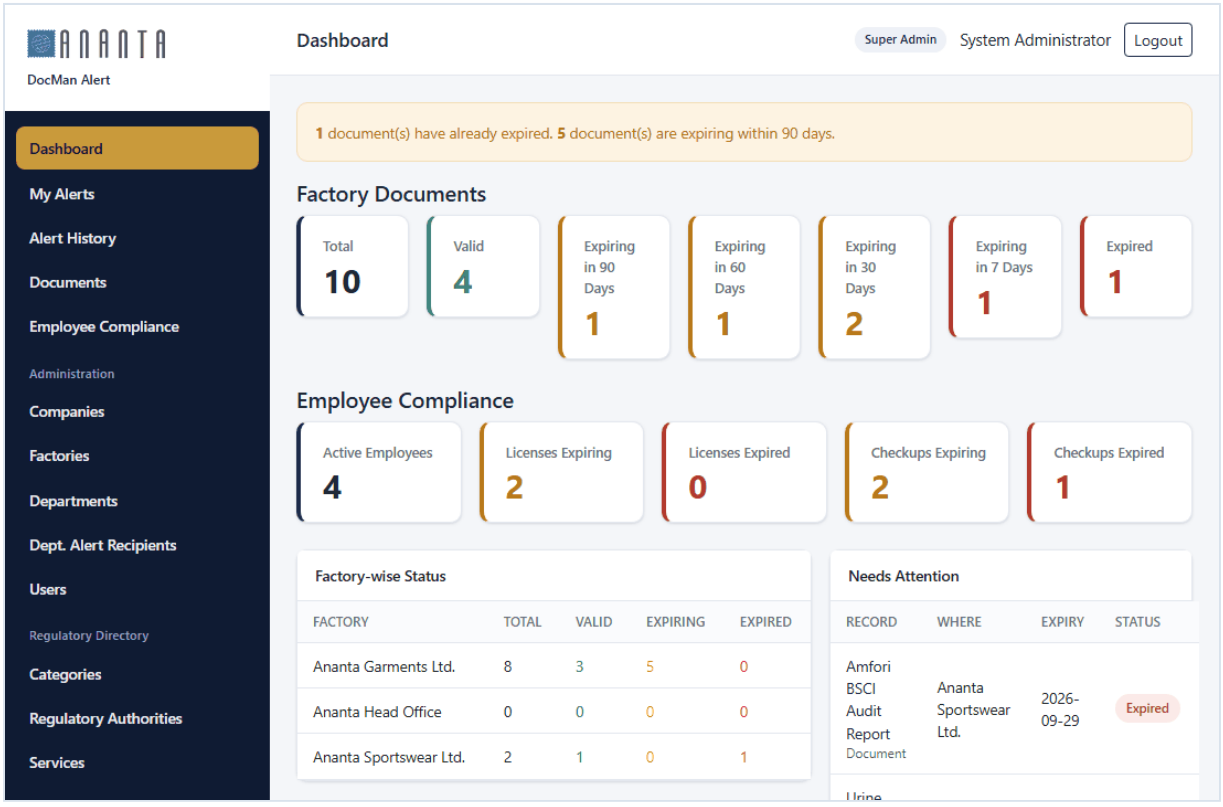

Figure 21. The menu of a Super Admin. Administrators see more of it than other roles.

Screen	Super Admin	Administration	Factory Admin
Users	All	-	Own factory
Companies	Add, edit, delete, recipients	View, recipients	-
Factories	All	-	-
Departments	Add, edit, delete	View	Add, edit, delete
Dept. Alert Recipients	All factories	All factories	Own factory
Regulatory Directory	All	-	-
Backups, System Logs, Import	Yes	-	-

6.1 Plan before you add anything

Set things up in this order on a new site, because each step needs the one before it:

1. **Company** and **Factories** (Super Admin).
2. **Departments**, with a group email where a shared mailbox exists.
3. **Users**, each with a role, a factory, a department and an email.
4. **Alert recipients** for companies and for factory and department pairs.
5. Then the people at the factories can start adding documents and employees.

6.2 Users

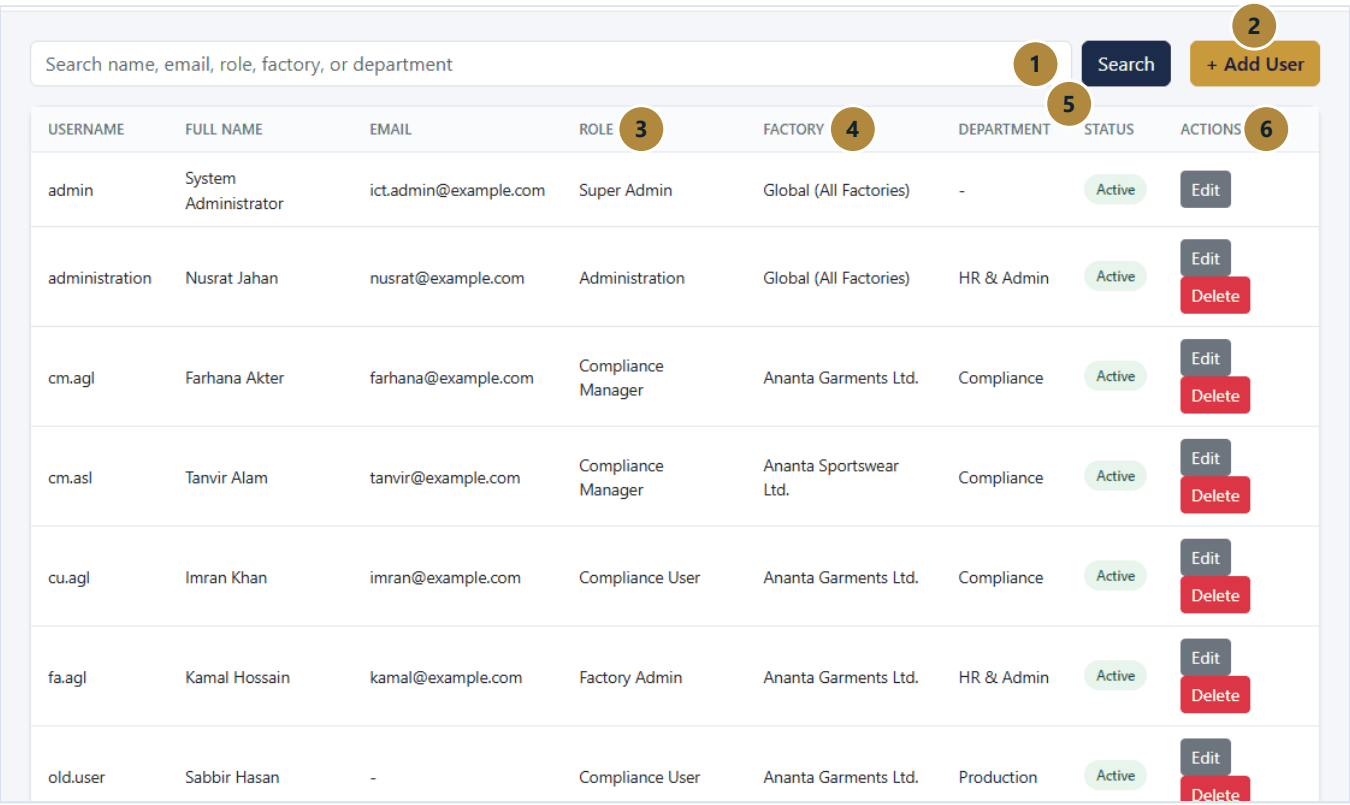

Figure 22. The Users page.

1. Search by name, email, role, factory or department.
2. **+ Add User.**
3. **Role.** Decides what the person can do.
4. **Factory.** "Global (All Factories)" means no single factory.
5. **Department.** Needed for alerts to reach this person.
6. **Edit** and **Delete**.

To add a user, click **+ Add User** and fill in:

Field	Notes
Username	Unique. Used to sign in. Cannot be reused.
Full Name	Shown in the top bar and on lists.
Email	Needed for the person to receive alerts. Without it they show as "No valid email" and cannot be ticked.
Role	See section 1.4. A Factory Admin can give Compliance Manager, Compliance User, Compliance Viewer, Transport Manager and Transport User.
Factory	The person's own factory. "None (Global Access)" is for Super Admin, Administration and Compliance Viewer, or for someone who should receive a department's alerts for every factory.
Department	Their department. Alerts are matched on factory and department, so set it.
Password, Confirm	At least 6 characters. Tell the person directly; the system does not email it.
Status	Active or Inactive. Inactive people cannot sign in and receive no alerts.

> **Important**
> A user with no factory whose role is not Super Admin, Administration or Compliance Viewer receives alerts for their department in every factory, but sees no records in the application. This suits a manager who only needs the emails. Give such a person the Compliance Viewer role if they also need to look at records.

Editing. Leave the password boxes empty to keep the current password. You cannot change your own role or active status; ask another administrator. Only a Super Admin can move a user to another factory.

Deleting. Click Delete and type the exact username. The person's past documents, versions and alert history stay; only the account and the links to it go. You cannot delete yourself, the built-in *admin* account, or the last Super Admin. A Factory Admin can delete ordinary users of their own factory but not Administration, Factory Admin or Super Admin accounts. To stop someone signing in without removing them, set Status to Inactive instead.

6.3 Companies, factories and departments

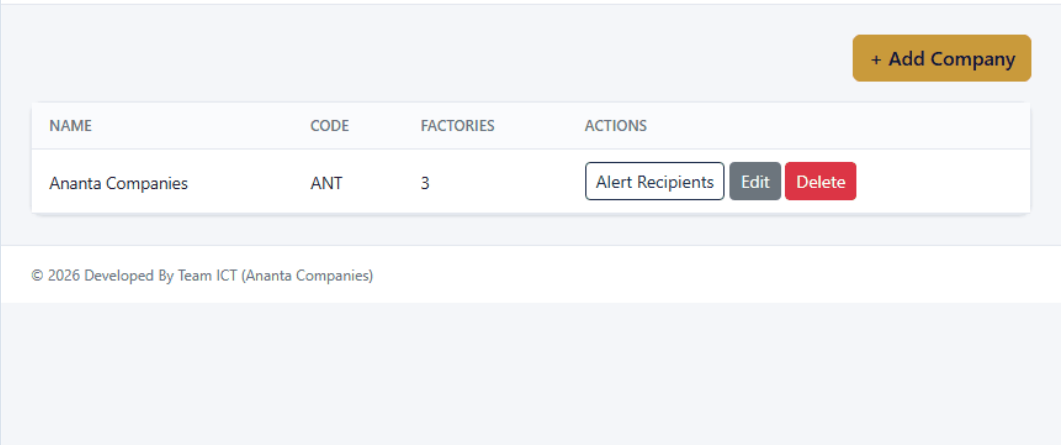

Figure 23. Companies. The Alert Recipients button sets who is emailed for the whole company.

- **Companies** hold factories. Only Super Admin adds, edits or deletes them. A company with factories cannot be deleted.
- **Factories** belong to one company. A factory with documents, employees or users cannot be deleted.
- **Departments** are one shared list for the whole company, not a copy per factory. Each can have a **Group Email**, a shared mailbox such as compliance_dept@ or transport_agl@. That mailbox receives alerts for every record in that department, whatever the factory. A department that is still used by documents or employees cannot be deleted.

6.4 Who receives alerts: recipients

There are three places to say who is emailed. The system uses them as the fallback ladder in section 5.3.

Where	Who it covers	Where to set it
On a document, license or checkup	That one record	The Alert Recipients ticks on its form
Department, per factory	Records of that department in that factory	Dept. Alert Recipients (menu), or Departments, then Alert Recipients
Company	Every record of the company's factories	Companies, then Alert Recipients

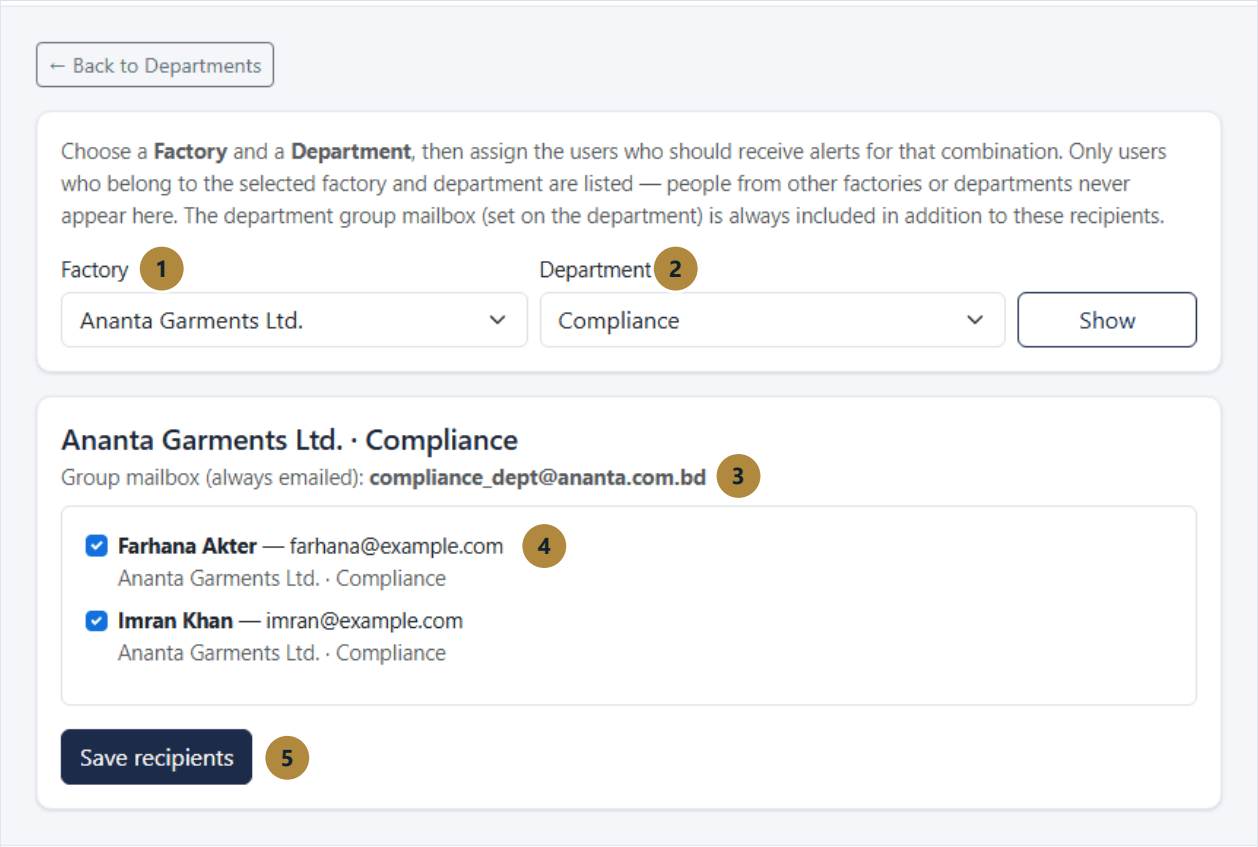

Figure 24. Dept. Alert Recipients: pick a factory and a department, then tick who receives the alerts.

1. Choose the **Factory**.
2. Choose the **Department**, then click Show.
3. The department's group mailbox. It is always emailed, so you do not tick it.
4. People who belong to exactly this factory and department. Tick the ones who should receive alerts.
5. **Save recipients.** People of other factories keep their settings.

> **Tip**
> Only users of the chosen factory and department are listed. If someone is missing, open their user account and check the factory and department.

6.5 Regulatory Directory

> **Administrators**
> Super Admin manages the lists. Super Admin and Administration can use them on documents.

The directory is a three-level list of government offices: **Category** (for example Environment), **Regulatory Authority** (for example the Department of Environment) and **Service** (for example Environmental Clearance Certificate renewal). On the document form, choosing a category narrows the authority list, and choosing an authority narrows the services. A category with authorities, or a service linked to a document, cannot be deleted.

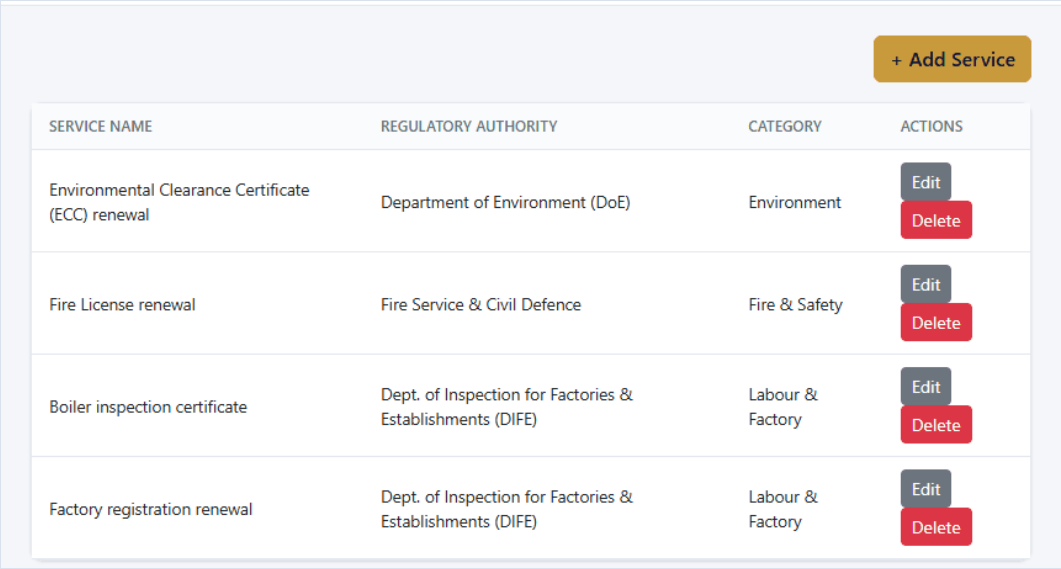

Figure 25. Services, with the authority and category they belong to.

6.6 Alert recipients for many people at once

To link many users to companies or departments in one go, use the **Alert Recipients** import (section 4.9). Duplicate links are skipped.

6.7 Backups

> **Administrators**
> Super Admin only.

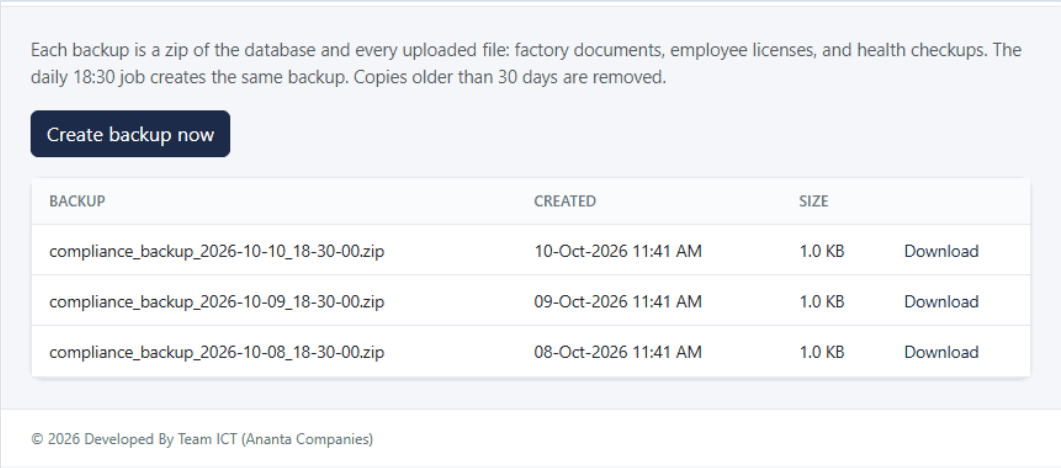

Figure 26. Backups. Each zip holds the database and every uploaded file.

- A backup is made **automatically every day at 18:30**. Backups older than the retention period (30 days by default) are removed.
- Click **Create backup now** before a risky change, such as a large import.
- Click **Download** to keep a copy off the server.
- Restoring is done by ICT with the restore script. Ask ICT, and say which backup you want.

6.8 System Logs

> **Administrators**
> Super Admin only.

System Logs record what the **system** did: sign-ins, scheduled jobs, backups, mail results, imports and OCR runs. They are for troubleshooting. They do not say who changed which document.

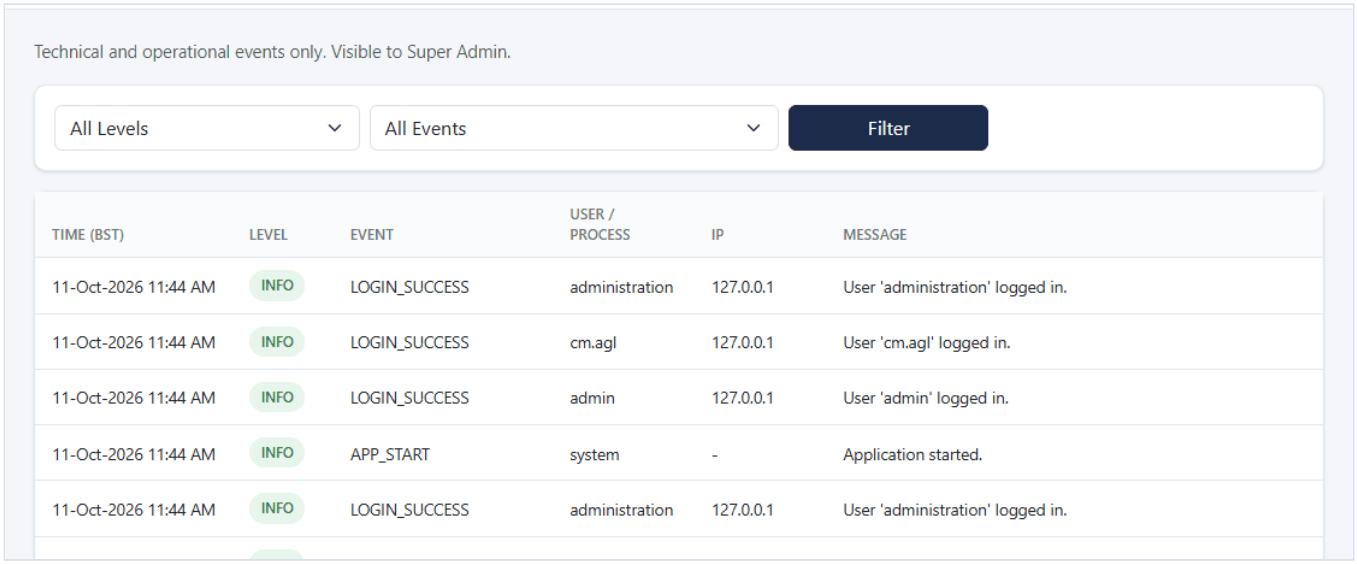

Figure 27. System Logs with level and event filters.

Event	Meaning
`LOGIN_SUCCESS, LOGIN_FAILURE`	A sign-in, a sign-out or a wrong password.
`ACCOUNT_SECURITY_EVENT`	An account was locked, or someone tried a locked account.
`JOB_START, JOB_SUCCESS, JOB_FAILURE`	A scheduled job ran, and how it ended.
`EMERGENCY_ALERT_SENT, ALERT_SENT, EMAIL_SUCCESS`	Urgent, manual or weekly mail was sent.
`ALERT_FAILED, EMAIL_FAILURE, EMERGENCY_ALERT_FAILED`	Some mail could not be sent. Check Alert History.
`ALERT_RECIPIENT_SKIPPED`	A user was skipped because their email is missing or invalid.
`BACKUP_SUCCESS, BACKUP_FAILURE`	A backup finished or failed.
`XLSX_IMPORT_*`	An Excel import started, finished or failed.
`OCR_STARTED, OCR_COMPLETED, OCR_FAILED`	Reading a file.
`UNHANDLED_EXCEPTION`	Something unexpected went wrong. Give the time to ICT.

6.9 A routine for administrators

How often	What to check
Every morning	Dashboard: anything red? Needs Attention is the work list. Alert History: any Failed results from the 09:00 run?
Every week	After Saturday 09:00, look at Alert History for failures. Review expired records that nobody has renewed.
When people join or leave	Add the user with factory, department and email, or set them Inactive. Update department recipients.
Every month	Backups: is the daily backup there? Download one copy. Users: are there accounts with no email or no department?

7. Good habits

- **Renew, do not duplicate.** Use Renew so the new file sits next to the old ones and the history is complete.

- **Always set the department.** It decides who is emailed.
- **Give every user an email address.** Users without one cannot be chosen as recipients.
- **Name documents so people can recognise them** at a glance: type, year, site if needed.
- **Attach the file.** A record without a file cannot be checked later and cannot be read by OCR.
- **Tick No expiry only when it is true.** Such records never alert.
- **Use Archive, not Delete,** when a record is simply out of date.
- **Review My Alerts** after you change jobs or departments, to see that your responsibilities still match.

8. Troubleshooting and questions

8.1 Problems and fixes

What you see	Why	What to do
I cannot see a factory's documents.	Your account belongs to one factory.	Ask your Factory Admin if you should have access to another.
A menu item or button is missing.	Your role does not include it.	Ask your Factory Admin.
Access denied (403).	The record is in another factory, or your role may not open that page.	Go back to the Dashboard. Ask an administrator if you need access.
Account locked.	Five wrong passwords.	Wait 10 minutes and try again.
File too large, or file not allowed.	Limit is 10 MB. Allowed: PDF, JPG, PNG, DOCX, XLSX.	Compress the file or save it as a PDF.
Expiry date must be on or after the issue date.	The two dates are the wrong way round.	Check both dates.
"Select a factory and a department to see matching users".	The list needs both.	Choose a factory and a department.
"No users belong to this factory and department".	No account has that pair.	Ask an administrator to set the factory and department on the users.
A person is greyed out with "No valid email".	Their account has no usable address.	An administrator should add the email to the user account.
OCR is currently unavailable.	The reading engine is not installed or is switched off.	Fill the form by hand and tell ICT.
Suggested date is empty or marked ambiguous.	The format could be read two ways.	Type it as 05 Jan 2026 or 2026-01-05.
A document vanished from the list.	It may be archived, or a filter is on.	Clear the filters, or click View Archived.
The status did not change after I edited.	Status follows the expiry date.	Check the expiry date and the No expiry box.
The employee gets no alerts.	Both an email and "Send alerts to this employee" are needed.	Edit the employee and set both.
Import row failed: unknown factory, company or department.	Names must match existing records.	Fix the spelling in the sheet, or add the record first.

8.2 Common questions

Do I need to click anything for the reminders to go out?

No. Weekly and urgent emails are automatic. Send alert is only for an extra, one-off message.

Why did I get five emails today?

Each email covers one record. Five expiring records give five emails.

Can I turn off an email for myself?

Not personally. Ask an administrator to remove you from the record, department or company recipients.

I entered the wrong date. What now?

Open the record, Edit, correct it and Save. The status and future alerts update straight away.

Can I undo a delete?

No. An archived document can be restored, but a deleted one cannot, which is why Delete asks you to type the name.

Why was I signed out?

You clicked Logout, or you closed the browser. Nothing signs you out while the browser stays open.

What time zone is used?

Bangladesh Standard Time (UTC+6) for statuses, schedules and every time you see.

What happens to a document's old files after a renewal?

They stay. Open the document and use the Files list.

Who can see my documents?

People whose role covers your factory, and administrators. Other factories cannot.

Where do I get help?

Your Factory Admin for access and roles. The ICT team for anything technical: a locked account that stays locked, an email that Alert History shows as Failed, or a page that will not load.

9. Quick reference

Emails at a glance

Email	When	Records	Subject starts with
Weekly reminder	Saturday 09:00	90, 60, 30 days left	Compliance Alert:
Urgent alert	Daily 09:00	7 days left, Expired	URGENT:
Manual alert	When sent	One document	Compliance Notice:

Files

Rule	Value
Allowed types	PDF, JPG, JPEG, PNG, DOCX, XLSX
Largest file	10 MB
OCR (reading a file)	PDF, JPG, PNG. Up to 10 MB and 50 pages
Excel import	.xlsx only, Super Admin

Where do I click?

To	Go to
Add a document	Documents, then + Add Document
Renew a document	Documents, then Renew on the row
Archive or restore a document	Documents, then Archive; View Archived, then Restore
Email someone now	Open the document, then Send alert
Add a license or checkup	Employee Compliance, open the employee, then + Add License or + Add Checkup
See my responsibilities	My Alerts
See what was sent	Alert History
Change who gets alerts	Dept. Alert Recipients, Companies or the record's own form

10. Glossary

Term	Meaning
Alert	An email the system sends about one record.
Archive	Hide a record from active lists while keeping its files. Documents can be restored.
BST	Bangladesh Standard Time, UTC+6. All dates and schedules use it.
Department	A department of the company, shared by all factories, such as Compliance or Transport.
Global Access	A user account with no factory. Used by Super Admin and similar roles.
Group mailbox	A shared email address set on a department that always receives its alerts.
OCR	Reading text from a scanned file so the system can suggest field values.
Recipient	A person who is emailed for a record.
Renew	Record a new issue and expiry date with a new file, keeping the old files.
Role	The set of things an account may do.
Status	Valid, Expiring in 90/60/30/7 Days, or Expired. Worked out from the expiry date.
Version	One uploaded file of a record. Renewing adds a version.

This manual matches DocMan Alert as of 11 October 2026. If a screen on your computer looks different, ICT may have updated the system; the ideas in this manual still apply.
